Indoor Environmental Quality Inspection

Whether your home or office is affected by a moisture-related event or other indoor environmental quality (IEQ) challenges, fast and accurate evaluation of the extent of the issue is critical to returning the building to a healthy balanced state. News about rising cases of childhood asthma, allergies and general wellbeing, as well as learning and behavioral problems has been linked to poor IEQ performance in buildings. Mold, particulates and chemical contaminants all contribute to comfort or health challenges indoors.

IET's services are designed to determine what contaminants are present, as well as their concentration. The development of an appropriate sampling strategy and the use of the proper sampling equipment are necessary to establish a baseline for your building. Once a baseline of contaminant levels has been established, IET then develops protocols for improving the air quality in a residential or commercial property.

IET has been performing these services since 1992 with thousands of satisfied clients in the commercial, residential, health care and education field.

No matter what your environmental issue or concern, most problems can be identified with proper testing, a thorough understanding of the building history and structure. Contact us today at 727-446-7717 so that we can answer further questions that you may have!

MEMBER OF

SERVICES OFFERED	
Air quality testing	Allergen testing
Mold inspection and testing	Formaldehyde / VOC testing
Moisture mapping	EMF / RF testing
Building Science	IR thermal imaging
Chinese/Corrosive Drywall	Baseline Building Health investigation
Expert Legal and Insurance support	Remediation protocol development
Post remediation testing	Photo documentation
Document review	Other testing
